

SHEPPARD CHIROPRACTIC

What is Sciatica?

"The pain may hit suddenly like a lightning bolt or it may cause a constant nagging ache, deep within your hip area." Chances are, you may never experience anything quite as painful in your entire life. Sciatica sufferers say it's like having an excruciating toothache in the leg.

You don't have to suffer needlessly from sciatic pain and you shouldn't depend on drugs to get the relief you're looking for. Drugs only mask the symptoms; they can't correct your structural problem.

What is sciatica?

Sciatica is a term that refers to the painful inflammation of the sciatic nerve, the longest nerve in the body.

Your sciatic nerve is formed from 5 nerve roots in your lower back, which join together deep in your pelvis. From there, the sciatic nerve divides into many branch nerves that serve your muscles, joints, skin and other tissues in your legs and feet.

What causes your sciatic pain?

1. Improper lifting.
2. Cumulative spinal stress.
3. Sudden impact or trauma.
4. Old injury.
5. Lack of exercise.
6. Over exertion.

The results are often the same-spinal misalignments or subluxations. Subluxations can occur following a car accident, a fall, or a sports injury, being over weight, ... or even an allergic reaction can lead to a spinal subluxation.

Left uncorrected, subluxations can cause the opening between your vertebrae to narrow and compress, irritating and stretching your nerves. Sciatica can often be traced to one or more misaligned vertebra.

The most common cause of sciatica is an irritation of nerve roots as they exit from your spine. Eventually, damaged nerves can restrict your joint movement, which interferes with the transport of lubrication to your discs. When unhealthy discs dry out, this causes the gel-like center to bulge out or herniated. The bulging or herniated disc matter can press against your sciatic nerve,

causing further irritation. Irreversible damage may occur if the nerve interference is not removed. That's where chiropractic comes in!

The goal of chiropractic is to locate the specific misaligned vertebrae and remove the resulting nerve irritation. Gentle chiropractic spinal adjustments can correct the underlying cause of your sciatica.

Early sciatic pain is often so mild that most people ignore it altogether. Prompt chiropractic care can help prevent sciatica or stop its progression. A recent Canadian study, published in the *Journal of Manipulative and Physiological Therapeutics*, found that 90% of the patients reported improvement with chiropractic care that were experiencing low back pain and radiating leg pain or numbness.

Call us at 753-5437 before the pain starts. It is easier to maintain a healthy spine than it is to treat an unhealthy one.
